

JSTree Summary

jsTree is a plugin that provides interactive document trees for documents on a website, this provides the ability to nest documents within folders on the site, allowing for easier access to specific information about a general topic and is user-friendly. jsTree provides a number of useful features for development such as;

- Drag & Drop support
- Inline edit, create and delete
- Keyboard navigation
- Customizable node types
- Support on Chrome, firefox, opera, safari and IE

During development, we decided to use jsTree for our tutorials pages, which allowed us to nest our documents into appropriate folders for our users to access when they were looking for a specific group of tutorials. We decided to use this instead of links to full pages with the information as it fits in with our simple user interface design. jsTree provide a number of demos on how jsTree works, here is an example from their site that may prove useful in understanding why we implemented it on our site;

And here is how it looks when we implemented it on our site;
