.NET SDK

Tmpst has been created as an ASP.NET Core web application and all the tutorials that tmpst offer are written in this framework. In almost all of the tutorials, the code provided can be used in any relevant environment (such as Atom or Notepad++), however, using a .NET Core web application would allow you to follow the tutorials exactly and produce the most accurate results.

In order to create a ASP.NET Core web application, you will have to install the ASP.NET Core SDK which is available here: https://dotnet.microsoft.com/download as well as in the references section below
